

PREDATOR

...Rugged with *Style*

COLOUR AT NIGHT

Night-time recording in full colour: Scene is 70 metres away

360 Vision's patented **White Light Predator** features embedded, combined technology, high intensity IR Light and White Light to give full colour CCTV images at night!

White Light is delivered through low power, high intensity LED beams, which generate full colour images at night, whilst discrete IR LEDs provide powerful, pin-sharp, mono images at up to 100 metres.

Unique and innovative software allows the user to set the automatic control parameters for the White Light activation. These include initiation by alarm, manual control (both locally and remotely) and by our latest feature, as part of a preset tour.

Green Credentials:

Predators use green patented technology to ensure that the highly efficient lights are only ever switched on when the camera itself determines that extra light is required. Currently available systems use inaccurate methods such as timer switches, light level sensors or manual control.

Utilising high intensity, low power, LEDs for both White Light and IR enables installers and end users to reduce costs. This is the result of a reduction in power consumption, cabling, hardware and in the quantity of separate external lighting - all with Green technologies included. 360 Vision offers end users peace of mind, that the patented White Light Predator is delivering the lowest possible carbon footprint.
