BOSCH
Invented for life

The DCN multimedia Camera Control software module makes it possible to interface the DCN multimedia system with Bosch Onvif compliant IP cameras. It selects the activation of fixed or pre-positioned cameras (such as Bosch HD Conference Domes), so that the current active speaker can be displayed during a meeting.

Functions

When a participant's microphone is activated, the camera assigned to that position is activated. When none of the microphones is activated, an overview camera is automatically activated instead. The video image is shown on the touch-screen of the Multimedia Device but can also be displayed on the Meeting Application or on hall displays together with information about the current speaker. Configuration is easy because all Bosch Onvif compliant cameras are automatically discovered.

The DCN multimedia Camera Control software module:

- controls Bosch Onvif cameras.
- controls TvOne C2-2355A in combination with TvOne S2-108HD, and Kramer MV-6.

- ▶ Automatically shows current speaker on display of multimedia devices
- ▶ Interface for Bosch Onvif compliant IP cameras
- ▶ Automatically discovers cameras

- enables HD-SDI video switching, so that HD-SDI video signals can be automatically switched and displayed with low-latency on one or more hall displays.
