The LEGIC advant product line ideally supports the design and realisation of access control and other person related service applications. It provides an advanced security, scalability and cost-effective investment protection.

Because of its advanced features and compliance with global industry standards, such as ISO 15693, ISO 14443 and LEGIC RF, the LEGIC advant product line is especially suitable for smart card projects, like single- and multifunctional company or leisure cards. Its target applications include ticketing, government ID, general access control and high security solutions for converged access (incl. IT access) and biometrics.

1 Efficient application and reader design – high connectivity, low power

The LEGIC advant product line supports simple and fast application integration for battery powered and line powered standard readers.

Convenient hardware integration and network connectivity is supported through the included common host interface.

Upgrades from other ID technologies like barcode, magnetic stripe or 125 kHz are easily realised.

2 Your choice of industry standards

The LEGIC advant product line supports all major industry RF standards giving you choice and flexibility:

- ISO 14443 A + B

Read/write access on various LEGIC and third party card technologies from low-end memory up to high security microcontroller transponders, used for payment, IT access, Government ID or in NFC mobile phones.

- ISO 15693

Read/write for vicinity standard applications with reading distance from proximity up to hands-free.

- ISO 18092

Near Field Communication devices such as NFC mobile phones and NFC tag types are supported with read/write access.

- LEGIC RF standard

Read/write of all LEGIC prime transponder products ensure investment protection and easy migration.

- Felica / Inside

Read/write access on transponders using Sony Felica RF protocol is given for the open memory area. Reads card serial number of transponders based on Inside Secure protocol, for example HID iClass.

Mixed standard operation / Migration

LEGIC advant modules can operate with mixed RF standards. Thus cards can be handled in parallel by one reader. This allows to run systems using credentials of varying RF standards. It offers seamless merging and migration of the issued cards.

Benefits that matter

Secure access

Secure e-payment

Ticketing – contactless leisure fun

3 Advanced security – tailor-made for each application

LEGIC advant provides security covering the data and applications in your contactless system all the way from the host to the storage of data on the transponder. This provides the right degree of protection in an open standard world.

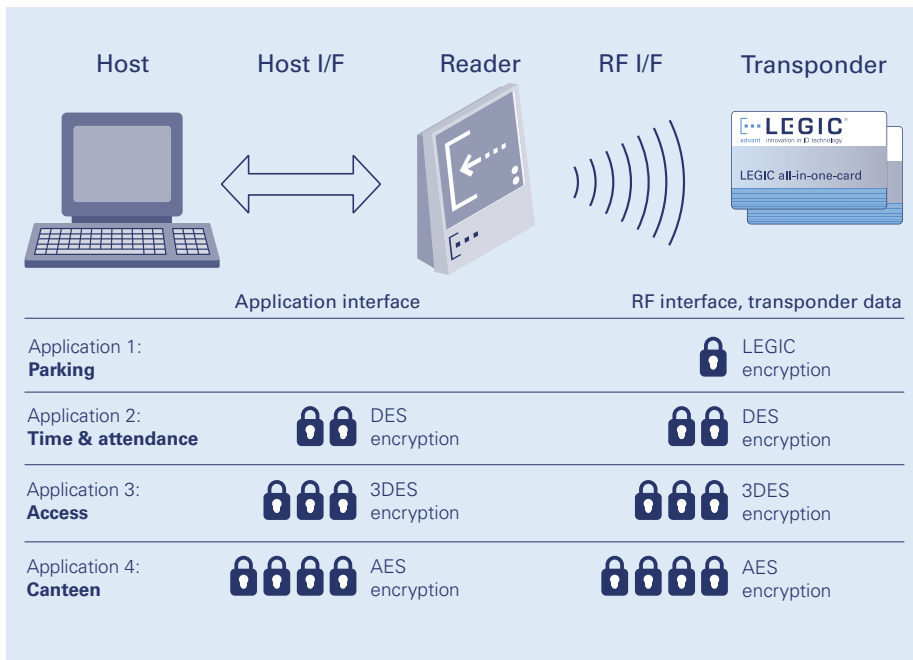

Security features include:

- mutual authentication
- advanced cryptographic data transmission and storage from host to transponder (end-to-end security)
- secure reading and writing of data
- user-definable read and write access protection
- key derivation
- key for additional data encryption can be defined by you

Configurable encryption

Strong encryption, up to the open industry standard algorithms AES and 3DES can be enabled for each application, providing strong protection for data and applications. Additionally, the key for the data encryption can be defined by your own. All keys are diversified transponder specific. This makes LEGIC advant suitable for use in IT access, high-value payment, biometrics or governmental solutions such as ID cards.

Example: four applications using different levels of encryption.

Benefits that matter

4 Master-Token based Security

Control

LEGIC's patented Master-Token System Control™ does not use easily compromised passwords. It provides comprehensive control of your security, your contactless smart card applications and thus your company. With over 100,000 installations worldwide already trusting LEGIC Master-Token based security control you will be in good company.

To create new credentials or authorise new readers within your security system the physical LEGIC Master-Token is needed. The security is provided through the genetic code which contains the authorisation to read or write card data. Master-Tokens transfer the genetic code to credentials during card initialisation and to readers during reader configuration. The mutual card / reader authentication and the unique genetic code allow a clear control over the credentials and system components.

5 Easy realised multiapplications

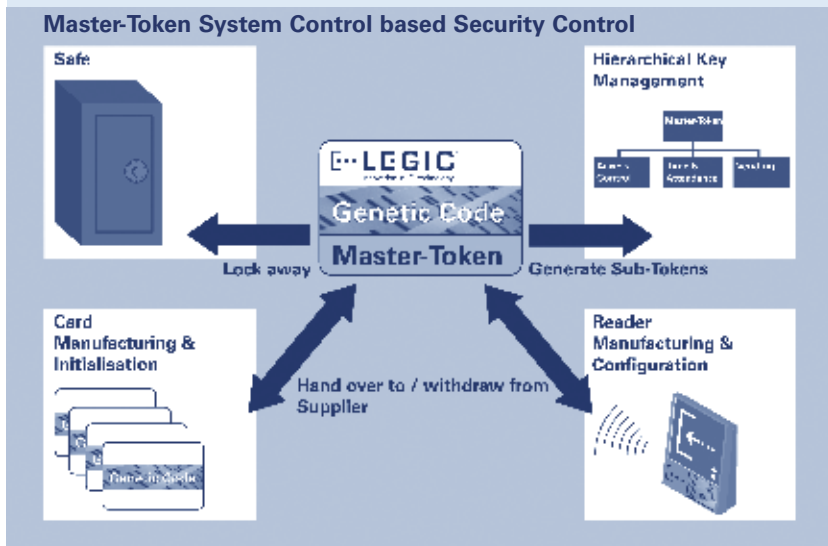

With LEGIC advant you can create multifunctional cards with up to 127 independent applications of various memory size on a single transponder.

Thanks to the variable memory allocation and the dynamic segment search functions, LEGIC allows easily realised multiapplication schemes with a high degree of flexibility. The dynamic multiapplication handling makes it simple to combine various applications of different type, memory size, supplier and ownership on a single

Business example: staff badges

Leading multinational corporations use the proven multi-functionality of LEGIC all-in-one cards: access control, time & attendance, payment, parking and many more. The Master-Token System Control puts you in real control over your cards, readers and the security of your Smart Card System.

6 Universal reader components for all Applications

The new LEGIC advant SM-4200 is the leading reader chip with powerful interoperability and all-in encryption package. The reader chip meets all major RF standards and becomes your preferred choice for battery powered and standard applications.

transponder. This is particularly beneficial if additional applications have to be added to a transponder that is already in use.

Unrivalled LEGIC advant[®] products

Modular reader products

LEGIC advant's cost-effective modular range of reader chip sets (SC) and the reader module (SM) allows you to easily expand functionality.

- LEGIC advant: card-in-card solutions for third party smart cards (see pages 7 and 8)

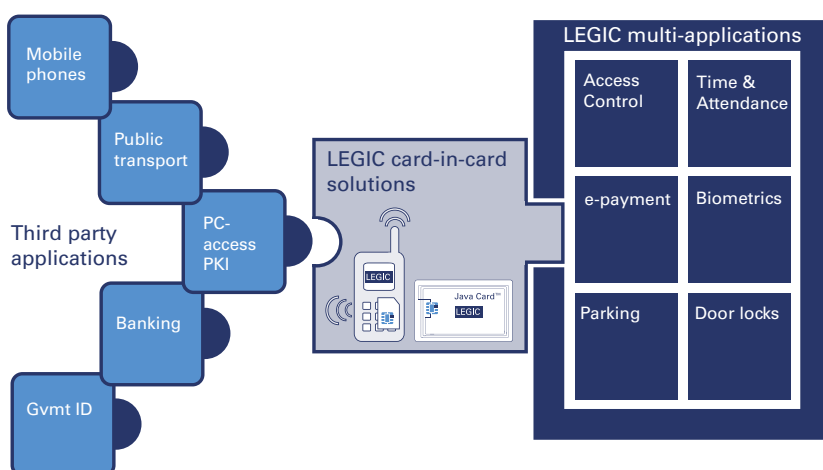

Unrivalled LEGIC advant[®] products

LEGIC card-in-card solutions for third party smart cards and NFC phones

LEGIC card-in-card solutions combine smart card microcontrollers with physical access and related multi-applications on one single smart card chip. The core element is the LEGIC all-in-one area which is a virtual multi-application transponder that behaves on the application level like all other LEGIC advant crypto transponders. The LEGIC all-in-one area runs on contactless smart card microcontrollers provided by third parties.

Smart card microcontrollers are commonly used for applications including logical access to PC and networks (PKI), mobile phones (SIM cards), banking and public transport. LEGIC card-in-card extends these with physical access and related multi-applications leading to extensive all-in-one multi-application credentials.

LEGIC card-in-card solutions combine third party applications with LEGIC applications on the same smart card chip.

Examples:

- Open doors and log yourself on to PCs using dual interface smart cards
- Enter football stadiums using your NFC phone

Benefits

Endless possibilities:

Enjoy the vast possibilities of the LEGIC contactless application world with dual interface smart cards and NFC mobile phones.

Easy integration:

Seamlessly use dual interface cards and NFC mobile phones the same way as crypto transponders.

Investment security:

Makes your system future proof through support of open card architectures (including Java Card™ and use of certified hardware up to EAL5+).

Access new markets:

Address emerging high volume markets both in the business and consumer areas through support of NFC enabled mobile phones.

User comfort:

Use your personal NFC mobile phone as your single credential for all contactless applications.

Cost benefits:

Save costs by using a single chip solution instead of two smart card chips used for hybrid cards; or just use your NFC mobile phone as your single credential.

Unrivalled LEGIC advant[®] products

Target markets for LEGIC card-in-card solutions

All solutions with a need to combine contactless or dual interface smart cards and NFC mobile phones with physical access and related multi-applications.

Security installations which require certified security, e.g. EAL5+.

Use the LEGIC all-in-one area on third party smart cards or NFC phones the same way as regular LEGIC all-in-one-cards.

Typical third party applications used together with LEGIC card-in-card solutions include:

- Logical access to PCs and networks (PKI)
- Public transport schemes / tourist cards
- Event ticketing / membership pass
- Contactless payment and credit / debit cards
- Large-scale contactless ID projects
- NFC mobile phones

Cryptographic authentication	112 bit
Max. number of applications	127
Memory segmentation	dynamic
Application segment size	variable
Certified hardware platforms	up to CC EAL5+

Helpful tools to ease your work

System configuration tools

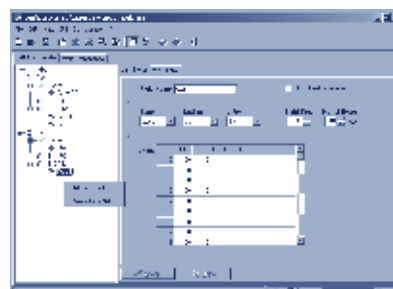

Configurator-Software CSW-2000

The Configurator Software CSW-2000 is a helpful tool to configure and analyse single- and multi-applications on LEGIC credentials.

With the CSW-2000 segments can be defined and credentials can be initialised (e.g. as Master-Token or as user credential). The configuration required for a project can be easily administrated. The graphical user interface enables a quick analysis of credentials as well as the configurati-

on of LEGIC advant reader modules. The CSW-2000 can be operated together with the Configurator Hardware CHW-2000, the Development Kit DK-2000 or a LEGIC advant 2000 based reader from a LEGIC partner.

The configurator's definition files can be ex- or imported and provide a standardized interface to collaborate with any third party, e.g. other LEGIC application providers, integrators, etc.

Configurator-Hardware CHW-2000

The LEGIC advant Configurator Hardware CHW-2000 is a universal desktop reader to initialise, write and read LEGIC credentials.

The robust desktop reader CHW-2000 is suitable especially to initialise and analyse LEGIC credentials. Its design is optimised to hold various credential shapes like cards, keys and fobs, wristbands and watches, as well as mobile phones.

The CHW-2000 can be operated with the LEGIC Configurator Software CSW-2000, the LEGIC Development Kit Software DKS-2000 or an alternative software available from a LEGIC partner. The integrated LEGIC advant reader module can be easily upgraded through the USB interface. Thus, new features are quickly available.

Helpful tools to ease your work

Evaluation and development tools

Evaluation Kit EK-4000

The Evaluation Kit EK-4000 provides easy access to the LEGIC advant 4000 series. It supports you in rapid and cost efficient development of battery and line powered readers for 13.56 MHz contactless smart card applications using LEGIC advant 4000 reader components.

Development Kit DK-2000

The LEGIC advant Development Kit DK-2000 supports the easy development of LEGIC advant 2000 based readers and application software and is particularly useful to evaluate the technology.

Antenna Designer AD-0500

The Antenna Designer is a world-wide unique tool for designing and dimensioning 13.56 MHz antennas for readers. It shortens time-to-market and saves costs, making antenna design easy for experts and less experienced engineers. Different antenna shapes with variable size from 10 to 120 mm and with or without shielding can be layouted, calculated and matched.

checked

Your benefits:

- Unique system control over cards, applications and installations
- Credential of choice – seamless use of credentials of different standards, range, memory and technology
- Advanced ready-to-use security and data protection – tailor-made per application
- High interoperability – through high level application standards
- Wide choice of applications
- Easy and cost effective reader & application design and credential management
- Future proof, high investment protection – expandable and scalable functionality
- Low total cost of ownership – scalable use of your cards – easy multi-application

Key features:

- Simultaneous multi-RF standard operation (ISO15693, ISO14443A+B, LEGIC RF, Sony Felica)
- Advanced security, AES (128, 256) / 3DES / DES encryption standards
- Physical Master-Token System Control and Automatic Key Management
- Easy multi-application support – allows adding applications on cards in the field
- Wide choice of crypto transponders and solutions for microprocessor based third party smart cards and NFC phones (virtual transponder, card-in-card solutions)
- Common application interface for seamless use of transponders, smart cards and NFC phones
- Versatile application protocols and peripherals interface
- Secure software (LEGIC OS) download for extensions and upgrades of readers in the field
- Cost effective modular system
- Integrated card detection and wake-up for long battery life
- Compliant to multiple industry standards
