

DVM-2000 & DVM-2200

12 Bit Video and 24 Bit Audio Fiber Optic Multiplexer

- Exceeds **RS-250C Short-haul** and **Broadcast Video** specifications.
- **12 Bit Video** with a **Signal to Noise** ratio greater than **75 dB** and a **Signal to Quantizing Noise** ratio of **74 dB**.
- Video **Bandwidth** of **8 MHz** for support of NTSC, PAL, SECAM and video with diplexed audio carriers at 4.5 MHz, 5.8 MHz and 6.4 MHz (Option for 10 MHz).
- **Differential Gain** and **Phase** of **0.2%** and **0.2°**, respectively.
- Video **Gain** and **1000 feet cable equalization** adjustments for the input and output.
- Differential video and audio inputs for superior **Common-mode Hum and Noise rejection** of greater than **60 dB**.
- Transport **Analog Video/Audio** or up to **540 Mbit/sec SDI** with **Automatic Switch-over** on the same fiber (Option for DVM-2200 only).
- **24 Bit Audio** flat from **20 to 20K Hz**, **S/N** greater than **90 dB** and **THD** less than **0.05%**.
- Video, Audio and Optical front panel status indicators with dry alarm relay contacts.
- **Coarse Wave-division Multiplexing (CWDM)** systems are available for up to **8 wavelengths** over **ONE optical fiber**.
- **Optical budget** of up to **28 dB** for Single-mode.
- Supports **1 video channel**, **6 audio channels** and **3 RS-232 data channels** over **one optical fiber**.
- Universal AC operation for **85-265 VAC** and Telco DC operation for **48 VDC**.
- Available in **portable**, **rack-mount** and **modular configurations** with all optical wavelengths, **LED Multimode** and **Laser Single-mode**.
- **Now support analog video, analog audio, serial digital video and digital audio in the same tray**. The UTIL-200-DVM Tray supports the DVM-2200 Video, 6 Audio and 3 Data Transport Cards, the DTV-220/230 SDI Transport Cards, the DTV-201/210F SDI Fan-out and Reclocking Cards, the DAM-2200 6 Audio and 3 Data Transport Cards and the AES-2200 6 AES/EBU and 3 Data Transport Cards.
- Applications include links from **studio to transmitter (STL)**, **studio to studio**, **studio to CATV head-end**, **common carrier**, **RBOC Telco circuits**, distance learning, **Intelligent Transportation Systems** & back-haul feeds from special events.

SPECIFICATIONS

Video Performance:

Exceeds the RS-250C Short-haul specification.

Signal to noise	> 75 dB
Differential gain	< +/- 0.2 %
Differential phase	< +/- 0.2 °
Chrominance to luminance gain.....	< +/- 0.5%
Chrominance to luminance delay.....	< +/- 5 nsec.
Frequency response to 6 MHz	< +/- 0.05 dB
3 dB Bandwidth	8 MHz
Luminance non-linearity	< 0.2 %
Ringing	< +/- 0.5 %
Tilt	< +/- 0.2 %
Video output & input impedance	75 Ohms
Delay, throughput.....	1.24 micro sec.

Audio Performance:

Signal to noise	> 90 dB
Frequency response to 20 Hz to 20 KHz	< +/- 0.1 dB
Distortion	< 0.05 %
Audio output level, adjustable	Unity, +/- 6 dBm
Maximum input & output level, 600 Ohm termination	+18 dBm
Audio output impedance, balanced.....	50 Ohms
Audio input impedance, balanced (selectable)	600 Ohms or High
Data channels	3 RS-232C at 9600 Baud
Power dissipation	< 15 Watts, per unit
AC operation	110 or 220 VAC (optional 48VDC)
Operating temperature	0 to +50 °C
Portable and Wall-mount:.....	7" L x 5 3/4" W x 1 3/4" H
Triple Rack-mount Kit for 3 modules (Part number -RMT):.....	7" L x 19" W x 1 3/4" H

Specifications subject to change without notice.

ORDERING INFORMATION:

Stand-alone and Rack-mount:

- DVM-2000-FTX-2, 12 Bit Video, Audio and Data Fiber Optic Transmitter, 1300 nm Multimode with ST connector, stand-alone.
- DVM-2000-FTX-50, 12 Bit Video, Audio & Data Fiber Optic Transmitter, 1300 nm Single-mode with FC connector, stand-alone.
- DVM-2000-FTX-6, 12 Bit Video, Audio and Data Fiber Optic Transmitter, 1550 nm Single-mode with FC connector, stand-alone.
- DVM-2000-FTX-7-xxxx, with DWDM 1470, 1490, 1510, 1530, 1550, 1570, 1590 or 1610nm Single-mode Laser -8 dBm with FC connector
- DVM-2000-FRX-2, 12 Bit Video, Audio and Data Fiber Optic Receiver, Sensitivity -24 dBm, Multimode with ST connector, stand-alone.
- DVM-2000-FRX-50, 12 Bit Video, Audio and Data Fiber Optic Receiver, Sensitivity -28 dBm, Single-mode with FC connector, stand-alone.

Modular:

- DVM-2200-FTX-2, 12 Bit Video, Audio & Data Fiber Optic Transmitter, 1300 nm Multimode w/ ST connector, modular for UTIL-200-DVM Tray.
- DVM-2200-FTX-50, 12 Bit Video, Audio & Data Fiber Optic Transmitter, 1300nm Single-mode w/ FC connector, modular for UTIL-200-DVM Tray.
- DVM-2200-FTX-6, 12 Bit Video, Audio & Data Fiber Optic Transmitter, 1550nm Single-mode with FC connector, modular for UTIL-200-DVM Tray.
- DVM-2200-FTX-7-xxxx, with DWDM 1470, 1490, 1510, 1530, 1550, 1570, 1590 or 1610nm Single-mode Laser -8 dBm with FC connector.
- DVM-2200-FRX-2, 12 Bit Video, Audio and Data Fiber Optic Receiver, Sens. -24 dBm, Multimode with ST connector, modular for UTIL-200-DVM Tray.
- DVM-2200-FRX-50, 12 Bit Video, Audio & Data Fiber Optic Receiver, Sens. -28 dBm, Singlemode w/ FC connector, modular for UTIL-200-DVM Tray.

Options:

- UTIL-200-DVM-2RU-AC, Analog, Digital & Fiber, 10 Slot, 2RU, Modular Utility Tray, w/ one 85-265 VAC Power Supply & Line Cord
- PS-200-DVM-AC, Modular 85-265 VAC Power Supply & Line Cord for 200 series trays
- UTIL-200-DVM-2RU-48VDC, Analog, Digital and Fiber, 10 Slot, 2 RU, Modular Utility Tray, with one 36-60 VDC Power Supply
- PS-200-DVM-48VDC, Modular 36-60 VDC Power Supply for 200 series trays
- WDM-95, Wave Division Multiplexer, (ask about DWDM options)
- RMD, Dual Rack-mount Kit.
- SDI IN, Serial Digital Video input for DVM-2200-FTX Transmitter with auto switch-over (optional)..
- SDI OUT, Serial Digital Video output for DVM-2200-FRX Receiver with auto switch-over (optional)

INTRODUCTION

Multidyne provides the television, cable, surveillance and transportation industries fiber optics systems of the highest video and audio quality and performance. We provide several digital video and audio fiber optic transport systems using **12-bit video and 24-bit audio encoding**. By using 12-bit digital video, we achieve a typical **Signal to Noise ratio of 75 dBs**. Our 24 bit digital audio provides a typical **Signal to Noise ration of greater than 90 dBs**. The test results below were performed using the industry standard Tektronix VM700A Video Test Set and a Multidyne TS12-10B Test Signal Generator.

The Multidyne **DVM-2000** Stand-alone, Video, Audio and Data Fiber Optic Transport System, the **DVM-2200** Modular, Video, Audio and Data Fiber Optic Transport System, the **DVM-2500** Bi-directional, Video, Audio and Data Fiber Optic Transport System and the **DVM-3000** Video, Audio and Duplex Data Fiber Optic Transport System are examples of products with 12 bit video and 24 bit audio technology.

VIDEO PROCESSING

There are no short cuts to achieve superior video performance. Close attention to signal quality has to be observed from end to end. This starts with the video input.

DIFFERENTIAL INPUT and HUM REJECTION

Most fiber optic systems have a single-ended video input. Multidyne provides a differential video input with superior common-mode noise rejection. This prevents the pick-up of noise and hum into your video signal. The differential input used in Multidyne equipment has an extended input voltage range, permitting the cancellation of larger amounts of hum. In real world studio and field applications all video equipment should have a differential input to cancel hum and noise.

CLAMPING and DC RESTORATION

Our systems include a high-speed clamp or DC restoration circuit. Without proper clamping, a video signal may clip or distort. Our systems have a wide input voltage range permitting operation with large amounts of DC offset voltage present in the video. The DC offset voltage can be caused by ground loops present in every application. This makes a clamping and DC restoration circuit with a wide input voltage range a necessity

CABLE EQUALIZER

Several Multidyne models include a video cable equalizer with a range of up to **3000 feet**. In every application there is some length of video cable connected to the fiber optic transmitter.

These systems also include a video gain control and video monitoring port. **This feature prevents the need for an external video distribution amplifier with cable equalizer.**

During installation, a video test signal source is connected to the transmitter. A Multidyne TS12-10B Test Signal Generator or equivalent is used to send a reference test signal. While observing the video monitoring port on the transmitter, the video gain and equalization are adjusted to receive 1 Vp-p video with a flat frequency response. This process ensures that the proper video signal level is applied to the analog-to-digital converter. If the video signal is low, the Signal-to-noise may suffer. If the video level is too high, the video signal may clip or distort.

HIGH QUALITY VIDEO OPERATIONAL AMPLIFIERS

Many manufacturers cut costs by using low quality video operational amplifier. The use of low quality amplifiers will distort the video signal and add noise. Multidyne only uses the highest quality video amplifiers.

DIFFERENTIAL GAIN AND PHASE

Low quality amplifiers and components can introduce many types of distortion. One type of distortion is Differential Gain and Phase. Differential Gain, DG, causes distortions in the fidelity and accuracy of the video color contrast level. Differential Gain is expressed as a percentage error in amplitude as the average luminance video signal changes. Differential Phase, DP, causes distortions in the fidelity and accuracy of video color tint or hue. Differential Phase is expressed in degrees of phase error as the average luminance video signal changes. The visual effects of Differential Gain and Phase are color saturation or level distortions and color tint or hue distortions. An example could be that a golf course appears to be yellow in color or the color green is faded. The lower the DG and DP the better.

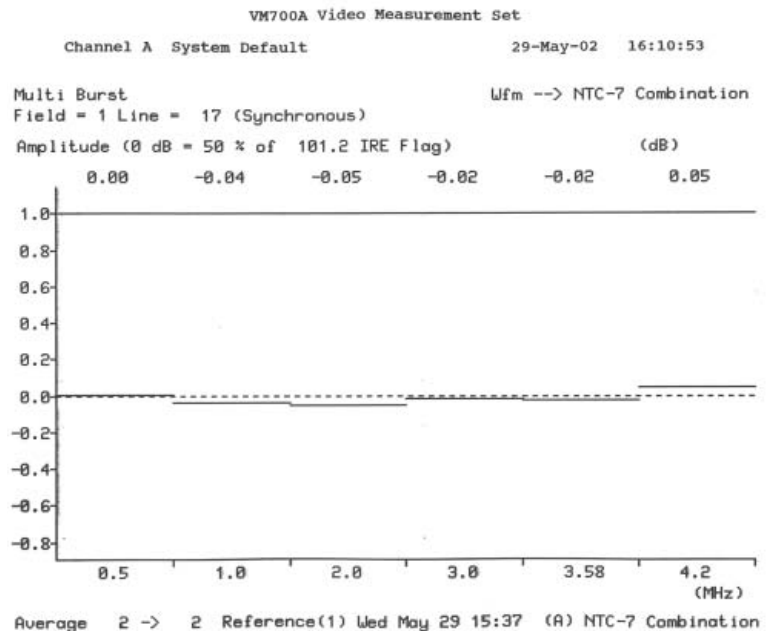

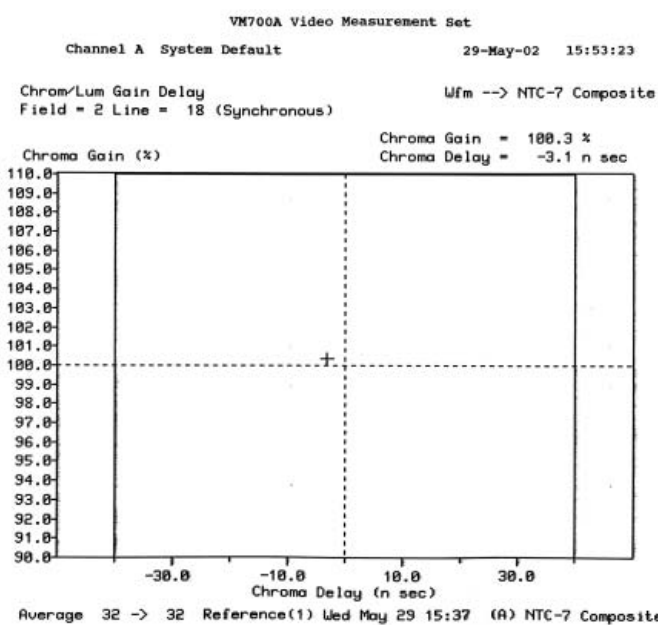

Many systems on the market have Differential Gain and Differential Phase of 2% and 2 degrees, respectively. Multidyne systems typically have **Differential Gain and Differential Phase of about 0.2% and 0.2 degrees**, respectively. The use of 12 bit video encoding also helps in the reduction of DG and DP.

FREQUENCY and PHASE RESPONSE

The next step is to use a high quality low-pass or anti-aliasing filter before the A-to-D process. If a filter is used with poor characteristics, the video quality will suffer. Most systems use cheap filters. The filters used by Multidyne have a **frequency response with a flatness of less than +/-0.05 dB**. There are systems on the market with greater than +/-1 dB flatness. Another important characteristic is phase or group-delay response. A good filter should have a constant delay throughout the video signal pass-band. If the phase characteristics are poor, the video color information can be smeared, delayed or miss-timed with respect to the rest of the picture. You may have seen examples of this. Picture a yellow racecar going around a track. You notice that the yellow of the car not exactly on top of the car. The yellow is slightly to the left or right of the car. The color information in the NTSC, PAL and SECAM television system is encoded on a frequency subcarrier. If the system introduces a phase shift or delay at the color subcarrier frequency, you get the effect with the racecar described above.

The **phase or group-delay characteristic** of Multidyne systems is typically **less than +/- 5 nano seconds**. There are systems on the market with more than 50 nano seconds delay.

After the video passes through our high quality anti-aliasing filter, the signal is sampled at 15 MHz with our 12 bit analog-to-digital converter. The digitized video, audio and data is multiplexed and serialized. The serial data stream is then sent through the fiber optic link. On the receiver side the digital video, audio and data signals are de-serialized and de-multiplexed.

RINGING and RISE-TIME DISTORTION

Another important characteristic of video filter design is pulse response. When a filter is not calibrated or designed properly, the pulse response characteristics will cause signal ringing and rise-time violations. The permitted amount of signal ringing is less than 1%. Many systems

have ringing in excess of 2%. Multidyne systems have **ringing of about 0.5%**. The permitted rise-time is 125 nano-seconds. Many systems have rise-times that are too fast or too slow. Multidyne systems have **rise-times** of extremely close to **125 nano-seconds**. The result of ringing and rise-time violations is distortions around edges in a video image. Ringing can be observed as multiple or busy edges. Long or slow rise-times can be seen as blurry or smeared edges.

VIDEO LINEARITY

The use of a 12-bit video encoding process reduces many types of distortion and noise. One parameter is linearity. Linearity most affects the video contrast level. The use of low quality video analog to digital and digital to analog converters will drastically affect the linearity. Many systems on the market have linearity distortions of greater than 2%. By using highly linear, 12 bit encoding, Multidyne is able to achieve **linearity deviations of less than 0.1%**.

SIGNAL-TO-NOISE AND SIGNAL-TO-QUANTIZING NOISE

The use of 12-bit video encoding most affects the Signal-to-noise and Signal-to-quantizing Noise. When more bits are used to encode information, the dynamic range from the smallest signal to the largest signal is increases. By increasing the signal dynamic range, the Signal-to-noise, S/N, is also increased. This is why a 12-bit system has better S/N than an 8 bit system.

When using a VM700A to measure S/N ratios, the analog contributions to the over-all system noise are only measured. This method is fine when measuring noise on an analog system. When measuring noise in a digital system, there are significant noise contributions from the digital encoding process called quantizing noise. When using a special Shallow Ramp test signal available with the Multidyne TS12-10B, the Signal-to-Quantizing noise can be measured. A Signal-to-Quantizing noise measurement is a more complete noise measurement for digital systems. **You should always ask for the Signal-to-Quantizing noise measurements results.** There are some systems on the market with good Signal-to-Noise results, but have very poor Signal-to-Quantizing noise. Any EIA/TIA-250-C Short-haul or broadcast quality system on the market should have a S/N and S/Q of greater than 67 dB. Many systems will have a S/Q of 62 dB. **The Multidyne systems typically have a S/N of 75 dB and a S/Q of 74 dB.** Even though a S/N and S/Q of 67 dB is the minimum requirement, there is a great benefit using a 75 dB S/N system. A video signal can be encoded and decoded several times with 12 bit technology and still maintain a 67 dB S/N and S/Q.

VIDEO RECONSTRUCTION

Once the digitized video, audio and data reach the receiver it is de-serialized, de-multiplexed and ready for reconstruction. A 12 bit digital to analog converter is used to convert the digital video back to an analog signal. A reconstruction or low-pass filter is required to restore

the video back into the original form. Again the same rules apply. If a filter is used with poor characteristics, the video quality will suffer as stated above.

AUDIO PROCESSING

There are no short cuts to achieve superior audio performance. Many of the same principals used for the video section are used for the audio section. Close attention to signal integrity has to be observed from end to end. This starts with the audio input.

DIFFERENTIAL INPUT and HUM REJECTION

Most fiber optic systems have single-ended audio inputs. Multidyne provides a differential audio input with superior common-mode noise rejection. This prevents the pick-up of noise and hum into your audio signal.

24 Bit AUDIO ENCODING

The use of 24-bit audio encoding most effects the Signal-to-noise. The Multidyne systems have **S/N ratios of greater than 90 dB** with a Total Harmonic Distortion or **THD of less than 0.05%**. Many systems on the market use 16 bit technology and have THD of greater that 1%.
