SynopSYS Version 2.0 Release

June 2011

The new SynopSYS Version 2.0 has been released. This version provides major benefits for Security Officers and for Integrators compared to the previous version, as detailed below.

Situation Management

The new SynopSYS version includes a totally new Situation Management mechanism. The mechanism guides the operator to act according to the predefined policy of the Security Manager. When an event occurs in the SynopSYS, a simple click guides the operator to handle the event and resolve it in a guided step-by-step manner. All operator actions are saved to the DB, allowing easy and convenient after-event investigation.

Guide setup for the events are built swiftly by the supervisor and can be triggered by single elements in the system (Camera, Door reader, intruder detector, fire detector, etc) or by binding several elements in the same location or area.

Scheduler

Another significant improvement is the new Scheduler module. The supervisor can now schedule tasks such as video recording, authorization and generating reports. Tasks can be scheduled to occur on a recurrent basis or one time only. Tasks are defined using a macro command tool, which also includes automation control and application commands.

The working days profile is defined in the built-in calendar for supervisor use. In addition, authorization levels can distinguish between two modes of operation: day mode and night mode. These Day/Night modes can be managed by the Scheduler.

Column	Column
Instructions	User Operation Required
Location	User Operation Done
Cameras	User Operation Required
Notifications	User Operation Required
Phonebook	User Operation Required
Programs Shortcuts	User Operation Required

New Drivers

- Axes Plus (RISCO's New Access Control system).
- EVT NVR (Vertex).
- VICON Video Systems (Viconet 5.2).
- HIKVISION Video Systems.
- Dedicated Micros Video Systems (Netview).

Additional Features

- A "Save & Restore" mechanism allows fast restoring of the project to predefined checkpoint, allowing integrators to overcome problematic changes in the project.
- A new "Server Configuration" module replaces the "SynopSYS Initialize" module. The new module includes email and SMS setup, server setup, backup and restore, DB operations, and more.
- Import\Export for Devices and Reports - Server Configuration, add ability for import\export devices and reports from\to the database.
- After event handling, the SynopSYS now returns to the identical situation and map that was displayed prior to the event.
- SynopSYS now works with SQL 2008 R2 Express 10 GIGA.
- Windows 7 OS, 64bit is now supported.
